

The steps we agreed to help you stay well

Following your call with Doccla. Everything we talked through is written down here, with the reason each step helps you.

Hello,

It was lovely to speak with you. We looked together at a few things that can make a real difference to your health, and agreed where to start. **There is nothing you need to do right now**, we are arranging these for you. This is just so you and anyone helping you have it all in one place.

5 steps we agreed together

1 A rescue pack for your chest

COPD · SELF-MANAGEMENT

We are asking your GP to prescribe a rescue pack for you to keep at home. This is a short course of steroid tablets and antibiotics, with a simple written plan for when to start them.

WHY THIS HELPS YOU

If you feel a flare-up starting, you can begin treatment within hours instead of waiting for an appointment. Starting early is the best way to stay well at home and out of hospital.

NICE guideline NG115 recommends a personalised self-management plan with rescue medication at home for people with COPD who have flare-ups.

2 Join a pulmonary rehab programme

COPD · STRUCTURED CARE

We would like to refer you to pulmonary rehabilitation. It is a friendly NHS group programme of gentle exercise and breathing advice, usually run over 6 to 8 weeks close to home.

WHY THIS HELPS YOU

It helps your breathing and fitness and lowers the chance of going into hospital. Most people say they feel steadier and more confident day to day.

NICE recommends pulmonary rehabilitation within 4 weeks for people who have been in hospital with a COPD flare-up.

3 Daily weight checks with new scales

HEART FAILURE · MONITORING

We will send you a set of scales and ask you to weigh yourself each morning. We will show you how, and your readings come straight through to your Doccla team.

WHY THIS HELPS YOU

A sudden weight gain can be an early sign of fluid building up, often days before you would feel unwell. Spotting it early means we can act quickly.

NHS heart failure guidance recommends regular weight monitoring at home to catch fluid retention early.

4 Protecting you from stroke

ATRIAL FIBRILLATION · STROKE PREVENTION

We will check with your GP that you are on the right medicine to thin your blood and lower your risk of a stroke.

WHY THIS HELPS YOU

With an irregular heartbeat, the right blood-thinning medicine is the most important thing we can do to keep you safe from a stroke.

NICE NG196 recommends anticoagulation for people with AF at raised stroke risk.

5 Gentle ways to get moving

PREVENTION & WELLBEING · LIFESTYLE

We will share simple NHS activity ideas you can do at home, including sitting exercises if standing is hard, and easy options like NHS Active 10 if you would like to build up gradually.

WHY THIS HELPS YOU

Moving a little more often, in a way that suits you, helps your breathing, heart, balance and mood, and makes everyday tasks feel easier.

NHS guidance recommends regular physical activity for adults, with adapted options such as sitting exercises for those with limited mobility.

We are here whenever you need us

You do not have to wait for your next call. If something does not feel right, or you are not sure about anything in this plan, please get in touch.

Doccla team · **0204 525 8330** · Mon to Fri, 8am to 8pm

With warm wishes,

Aisha Khan

Your Doccla care team

If you feel very unwell quickly, have chest pain, or are very breathless, do not wait: call 999 or 111 as you normally would. This plan supports your usual NHS care, it does not replace advice from your GP or hospital team.
